

CPH 200C PS3 · CLINICAL AI BY REGION

Three Governing Systems for Clinical AI

Why deployed clinical AI looks different across the US, Europe, and Asia: policy, funding, technical developments, and landscape

Curtis Chambers · **Jinchi Wei**

CPH 200C · Computational Precision Health

2026-06-04

Slide 1 –

The lens: deployed clinical AI

Deployed clinical AI is mostly radiology - a named, in-production system per modality:

Three regions, three governing systems for AI

UNITED STATES	EUROPE / EU	ASIA
Market-led	Comprehensive	China-led
Light federal + state patchwork; deregulate to 'win the race'. Closed frontier labs, deepest capital.	Horizontal risk-tiered AI Act (now softening). Sovereignty money, little frontier building.	State-driven core (China: open-weight, population scale). Korea/Japan/India build their own models. Asia owns the AI hardware: TSMC, HBM, Foxconn.

Three governing systems (US / EU / Asia), tested on one case.

Evidence base: npj Digital Medicine - Nature Medicine - Lancet Digital Health
- JAMA - JMIR - Stanford AI Index 2026 - MIT NANDA

Slide 2 – The lens: deployed clinical AI

The lens

Set the frame: three regional AI governing systems, tested on deployed clinical AI because that is where the peer-reviewed evidence is strongest and the divergence sharpest. The radiology gallery makes it concrete: most deployed clinical AI is imaging, and each modality already has a named, in-production system, chest X-ray (Oxipit ChestLink, the EU autonomy milestone), mammography (Korea's Lunit INSIGHT, FDA-cleared), retinal fundus (IDx-DR, the first FDA-cleared fully autonomous diagnostic AI, in the US), and chest CT (China's Infervision, about 20,000 lung scans a day). Note the spread maps onto the regional thesis. Read the evidence-base line so the audience knows this is research-grounded. Then walk the four axes: policy, funding, technical, landscape.

What leaders predicted, and what's different now

CHINA	UNITED STATES	EUROPE / EU
Kai-Fu Lee AI Superpowers (2018) The age of implementation: execution and data, not breakthroughs, decide the race, favoring China.	Eric Schmidt et al. The Age of AI (2021); NSCAI AI is a national-security race the US must win; warned of China closing the gap fast.	Mario Draghi EU Competitiveness Report (2024) Europe regulates but does not build; structurally behind on compute, capital, and scale.
WHAT'S DIFFERENT NOW (2025): None predicted a Chinese OPEN model (DeepSeek) would reset the frontier while US labs re-closed. Lee's implementation thesis holds, but the ROI gap shows capability is not yet value.		

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 3 – What leaders predicted, and what's different now

Predictions vs now

This is the framing slide, and it earns the research framing. Three influential thinkers each forecast the AI race. China: Kai-Fu Lee's AI Superpowers (2018) argued we had entered the age of implementation, where execution and data, not breakthroughs, decide the winner, which favored China. US: Eric Schmidt, co-author of The Age of AI and chair of the National Security Commission on AI, framed it as a national-security race the US must win and warned China was closing fast. Europe: Mario Draghi's 2024 EU competitiveness report diagnosed that Europe regulates but does not build. What is different now, the purple band: the 2025 open-weight surge surprised everyone, a Chinese OPEN model reset the frontier while US labs re-closed, the opposite of what was expected. Lee's implementation thesis largely held, but the ROI gap shows capability is not yet value. Transition: with that frame, the four axes, starting with policy.

POLICY

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI

Slide 4 – Policy

Transition: how each region regulates clinical AI.

Regulating clinical AI

Clinical AI: the US approves the most discrete tools; China deploys at the most scale

Cumulative AI device approvals

Han et al. (Lancet Digit Health 2024): most clinical-AI RCTs remain few and early-stage.

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

United States

Device-by-device 510(k) + PCCP. ~1,451 AI/ML devices cleared, 76% radiology; generative/LLM CDS still has no pathway.

Bedi et al., npj Digit Med 2025

Europe / EU

AI Act high-risk stacked on MDR/IVDR (double conformity); few dual-designated notified bodies; health-data space deferred to 2029.

EU AI Act + MDR/IVDR

Asia (China)

State-coordinated NMPA: 154 AI devices, ~80% the higher-risk Class III with mandatory clinical trials.

China NMPA AI-device review, JMIR 2026

Slide 5 – Regulating clinical AI

Policy

Three regulatory philosophies, straight from the clinical literature. US clears the most devices (~1,451, 76% radiology, per Bedi et al. in npj Digital Medicine) device-by-device, but has no pathway for generative/LLM tools. Europe regulates hardest: AI Act high-risk stacked on the existing device law, a double conformity burden. China is state-coordinated, fewer approvals but mostly higher-risk Class III with trials (JMIR 2026). Footnote: Han et al. in Lancet Digital Health found clinical-AI RCTs are still few and early, so the evidence base is thinner than the device counts suggest. Aside if asked about general US AI policy: a June 2026 EO added a voluntary pre-release frontier-model review and a Treasury cyber clearinghouse, but it is non-clinical and bars mandatory licensing, so it does not change the clinical picture. Transition: who pays.

FUNDING

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI

Slide 6 – Funding

Transition: capital versus the reimbursement pathway.

Capital versus reimbursement

Private AI investment, 2025

Stanford AI Index (US, China). *Europe = est. EU+UK AI VC. The US captured ~83% of global private AI investment.

Stanford AI Index 2026. US ~83% of global PRIVATE AI investment.

Caveat: that counts private capital only. China's state guidance funds raised ~\$900B across 2,178 funds, plus a new ~\$138B national fund (Dec 2025, 20-yr), so total Chinese AI capital is materially higher and hard to measure from outside (Stanford 2025; gov.cn 2025).

United States

Capital-rich, reimbursement-poor: mostly temporary CPT Category III codes + capped NTAP; few permanent Medicare pathways.

Health Tech Investment Act 2025

Europe / EU

National fast-tracks. Germany's DiGA reimburses ~60 apps (>1M prescriptions); France's PECAN copied it.

DiGA / BfArM

Asia (China)

State funding + volume-based procurement drive deployment without a Western-style reimbursement market.

NMPA / state procurement

Insurers also use AI to deny coverage.
Mello & Rose, JAMA Health Forum 2024

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 7 – Capital versus reimbursement

Funding

The twist for clinical AI: the US has ~83% of global private AI investment (Stanford AI Index), but capital is not what gets a tool used, reimbursement is, and there the US is poor (temporary CPT codes, capped add-on payments). Europe leans on national fast-tracks, Germany's DiGA actually works (~60 apps, >1M prescriptions). China sidesteps reimbursement entirely via state procurement. Caveat under the chart: that 83% is PRIVATE investment only, so it undercounts China, whose state guidance funds raised roughly 900 billion dollars across 2,178 funds, plus a new 138-billion-dollar national fund in December 2025, meaning total Chinese AI capital is materially higher and hard to measure from outside. For clinical AI, though, the payment pathway is still the binding form of funding. Transition: and just how big is the US bet?

How big is the US AI buildout?

~1.6%

of US GDP now goes to AI infrastructure.

Already larger than the Apollo Program, the Manhattan Project, or the dot-com telecom buildout.

But a fraction of WWII (~38% of GDP) or the New Deal public-works surge.

A generational capital bet: serious, but not historically unprecedented.

Tomasz Tunguz / Theory Ventures, 2025. AI infrastructure spending as a share of US GDP, vs major historical buildouts.

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 8 – How big is the US AI buildout?

US AI buildout, in scale

A quick scale check, with a clean third-party chart from Tomasz Tunguz of Theory Ventures. It plots AI infrastructure spending as a share of US GDP against the country's great buildouts. AI infrastructure is about 1.6 percent of GDP, already larger than the Apollo Program, the Manhattan Project, or the dot-com telecom buildout, but a fraction of World War II at roughly 38 percent or the New Deal public-works era. The funding takeaway: the US AI capital story is a serious, generational bet, but it is not historically unprecedented, which is worth holding in mind when we ask whether the spend pays off. Transition: that money still has to clear the technical constraint.

TECHNICAL DEVELOPMENTS

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI

Slide 9 – Technical developments

Transition: the chip constraint and the two innovation paths it forces.

The chip war reshapes the race

The chip war, 2022-2026: escalation, reversal, and China's pivot to domestic silicon

From the Oct 2022 controls to the Jan 2026 H200 case-by-case reversal, the GPU ceiling is the constraint that shapes every region's technical strategy.

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 10 – The chip war reshapes the race

Chip war

How to read it: a timeline of US export controls and the NVIDIA-China saga. What to say: from October 2022, the US progressively tightened controls on advanced AI chips, closing loopholes, adding the H20 ban, then abruptly reversing in 2025-26 to case-by-case H200 sales with a tariff. The single point: the GPU ceiling is the binding constraint that shapes how every region pursues better models, which sets up the next slide.

Transition: it pushed two very different innovation paths.

Scale versus constraint: two paths to better models

UNITED STATES: SCALE

Answer the race with compute: Stargate (\$500B), ~\$700B hyperscaler capex in 2026, nuclear power deals. Frontier models stay closed. Abundant GPUs mean less pressure to economize.

Stargate; hyperscaler capex 2026

CHINA: CONSTRAINT

Capped on advanced GPUs by export controls, efficiency becomes the edge: mixture-of-experts, distillation, DeepSeek's ~\$6M training run, cheap inference. Necessity drives method innovation.

DeepSeek-V3 technical report, 2025

The provocative read: the GPU ceiling may be pushing China toward genuine methodology innovation, while the US mostly scales hardware. May 2026: Huawei's chairman publicly thanked the US for export controls, saying they 'supercharged' China's chip industry (Tom's Hardware; SCMP).

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 11 – Scale versus constraint: two paths to better models

Scale vs constraint

This is the most interesting technical point, and it represents both the US and China. The US answers the compute race with scale, Stargate's 500 billion dollars, roughly 700 billion in 2026 hyperscaler capex, nuclear deals, and keeps frontier models closed; abundant GPUs mean little pressure to economize. China, capped on advanced chips by export controls, is pushed the other way, toward method innovation: mixture-of-experts, distillation, DeepSeek's roughly 6-million-dollar training run, efficient inference. This slide is deliberately US vs China, the two sides actually racing on the model frontier. The provocative read, worth saying out loud: the GPU ceiling may be backfiring, driving genuine methodology innovation in China while the US mostly throws more hardware at the problem. Fresh evidence, end of May 2026: Huawei's rotating chairman publicly thanked the US for the export controls, saying they supercharged China's chip industry, and Huawei pitched a data-throughput scaling law to route around the EUV lithography it cannot buy. Treat the architecture claim as unverified, SCMP itself asks breakthrough or hype, but the posture, China openly framing the controls as counterproductive, is the point. Transition: and that open, efficient Chinese model is exactly what reached hospitals.

Open weights reach the bedside

China's open-weight surge

Open models (DeepSeek, Qwen) rose from ~1% to ~40%+ of OpenRouter usage in a year; HF downloads China 17.1% > US 15.9%

Chinese open models, share of usage on a major model router.

The DeepSeek moment

An open, frontier-quality reasoning model at low cost reset the board in Jan 2025; ~\$600B wiped off NVIDIA in a day.

NVIDIA -17% selloff, Jan 2025

Into hospitals, fast

~261 Chinese hospitals locally deployed DeepSeek-R1 in Q1 2025 (84% tertiary), outpacing regulation.

DeepSeek-R1 in 261 hospitals, Nat Med 2025

The Western void

FDA's Jan 2026 CDS guidance is silent on generative/LLM clinical AI; the EU defaults it to high-risk.

FDA CDS guidance, Jan 2026

RCT caution: an LLM did not significantly improve physician diagnosis. Goh et al., JAMA Netw Open 2024

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 12 – Open weights reach the bedside

Technical

The open-vs-closed split reaches medicine fastest where oversight is state-coordinated. After DeepSeek's open reasoning model landed (Jan 2025), a Nature Medicine study documented ~261 Chinese hospitals locally deploying it within one quarter, mostly tertiary centers, deployment outran regulation. Contrast the West: FDA's Jan 2026 CDS guidance is silent on generative AI; the EU defaults LLM clinical tools to high-risk. The model exists everywhere; one system let it reach the bedside at scale. Transition: who deploys, overall.

The frontier standing: who actually leads

UNITED STATES	ASIA (CHINA)	EUROPE / EU
Holds the absolute frontier Claude Opus 4.8, GPT-5.5, Gemini 3.1 lead the top tier; 50 notable models in 2025 vs China's 30. artificialanalysis.ai; Stanford AI Index 2026	Fast follower, cheap + open Within ~2.7% on Arena, ~7-month lag. DeepSeek V4 (Apr 2026) near-frontier at ~1/10 the cost; dominates open weights. Epoch AI; Stanford AI Index 2026	Thin at the frontier Mistral is the lone challenger; DeepMind sits under US (Google) ownership. Draghi report, 2024
The frontier crown is still American. China's edge is open weights and cost, not the top tier, and the proprietary lead may even be widening.		

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 13 – The frontier standing: who actually leads

Frontier standing

The honest balance, and the slide that gives the US its due. For all of China's open-weight momentum, the absolute frontier as of mid-2026 is still American: Claude Opus 4.8, GPT-5.5, and Gemini 3.1 lead the top tier, and the US produced 50 notable models in 2025 to China's 30. China is a fast follower, within about 2.7 percent on the Arena leaderboard and lagging roughly 7 months on average (Epoch AI), and DeepSeek V4 in April 2026 reached near-frontier quality at about a tenth of the cost, which is itself the constraint-breeds-efficiency story. But near-parity-and-cheaper is not the same as leading. The band says it: the frontier crown is still American, China's edge is open weights and cost, and the proprietary top-tier lead may even be widening. Transition: so how do we even measure these clinical models?

LANDSCAPE

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI

Slide 14 – Landscape

Transition: who actually deploys, and whether it works.

Who deploys clinical AI at scale

UNITED STATES	EUROPE / EU	ASIA (CHINA-LED)
~1,451 AI/ML devices cleared; 76% radiology - Reimbursement-gated: temporary CPT III codes - Slowest path from clearance to bedside Bedi et al., npj Digit Med 2025	- AI Act high-risk + MDR/IVDR double burden - Nationwide AI mammography deployed (Germany) - DiGA the working reimbursement route Eisemann et al., Nat Med 2025	- Ant Group AQ app: 100M+ users, 5,000+ hospitals ~261 hospitals ran DeepSeek-R1 in Q1 2025 - Korea exports: Lunit FDA-cleared, ~1M mammograms/yr DeepSeek-R1 in 261 hospitals, Nat Med 2025

Approvals and deployment are different axes: the US leads on count, Asia on scale.

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 15 – Who deploys clinical AI at scale

Landscape: who deploys

Deployment inverts the approval count. The US approves the most devices but they are narrow and reimbursement-bottlenecked, so bedside reach is slow. Europe is slowest, gated by its own AI Act plus device law. Asia, led by China, deploys at a scale neither matches, Ant's AQ app reaches 100M+ users and 5,000+ hospitals, ~261 hospitals ran DeepSeek-R1 in Q1 2025 (Nature Medicine), and Korea exports FDA-cleared tools like Lunit. Approvals and deployment are different axes. Transition: but does deployment at scale actually help patients?

Real-world clinical AI, by region

UNITED STATES	EUROPE / EU	ASIA (CHINA)
Commercial scale, narrow tools Aidoc: 1,600+ centers, 100M+ cases. Viz.ai stroke: 1,800 hospitals. FDA-cleared, radiology and acute triage. Aidoc; Viz.ai, 2025-26	The autonomy milestone Oxipit ChestLink: world-first FULLY AUTONOMOUS radiology AI (CE Class IIb), auto-reports ~40% of normal chest X-rays, a clearance the FDA has not granted. Oxipit / Sectra, 2026	Population-scale screening Infervision ~20k lung scans/day; Tencent Miying in 100+ hospitals; Ant AI 100M users; DeepSeek-R1 in 261 hospitals. Nature Medicine 2025; co. data

Real systems, same split: the US scales narrow tools, Europe pioneers autonomy under stricter rules, China deploys at population scale.

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

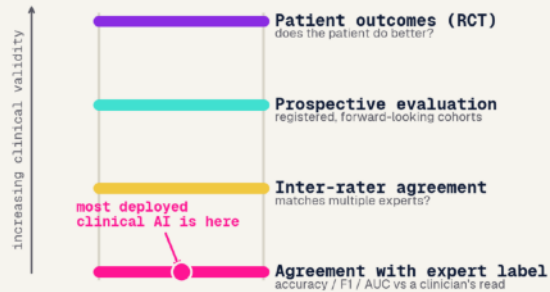

Slide 16 - Real-world clinical AI, by region

Real-world clinical AI

Concrete, named systems actually in hospitals, not abstractions. United States: the deepest commercial scale of narrow FDA-cleared tools, Aidoc is in over 1,600 medical centers with 100 million-plus cases analyzed, Viz.ai's stroke platform is in 1,800 hospitals. Europe: fewer deployments but the autonomy milestone, Oxipit's ChestLink is the world's first fully autonomous radiology AI, CE Class IIb, auto-reporting roughly 40 percent of normal chest X-rays with no radiologist, a level of autonomy the FDA has not cleared. China: population-scale screening, Infervision runs about 20,000 lung scans a day, Tencent Miying is in over 100 hospitals, Ant's AQ app reaches 100 million users, and DeepSeek-R1 went into 261 hospitals. The band: same regulate-build-deploy split, now in real systems, US scales narrow tools, Europe pioneers autonomy under stricter rules, China deploys at population scale. Transition: but does any of it pay off?

The ROI reality

The validation gap: agreement is not benefit

Agreement with a label is not benefit to a patient.

95%

of enterprise gen-AI pilots showed no measurable P&L impact (MIT NANDA 2025)

Who closes the validation gap?

UNITED STATES

Reimbursement scrutiny forces some evidence, but approval is still label-based.

EUROPE / EU

Demands evidence ex-ante (AI Act + MDR), yet the health-data space is deferred to 2029.

ASIA (CHINA)

Deploys before outcomes are proven, the fastest rollout, the widest validation gap.

Han, Lancet Digit Health 2024 - Challa et al. (MIT NANDA) 2025

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 17 – The ROI reality

Landscape: ROI reality

The sober counterpoint, and the most research-grounded slide. MIT NANDA found 95% of enterprise gen-AI pilots delivered no measurable financial impact. And in clinical AI specifically (the ladder figure): most tools are validated against expert labels, not patient outcomes, so high agreement with a clinician is not the same as being right about the patient. Han et al. (Lancet Digital Health) make the same point, the RCT evidence is thin. That gap, between deployed and beneficial, is exactly the deployed-clinical-models problem. Transition: pull it together.

SYNTHESIS

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI

Slide 18 – Synthesis

Transition: the split in medicine, takeaways, references.

Regulate, build, deploy, in medicine

How clinical AI reaches patients: three pathways

The bottleneck on deployed clinical AI is institutional, regulation, payment, and coordination, not model quality.

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 19 – Regulate, build, deploy, in medicine

Synthesis

The whole talk in one figure: three pathways clinical AI takes to patients. US approves device-by-device but stalls at reimbursement. Europe stacks the AI Act on device law, the slowest. China runs NMPA to state procurement to population-scale deployment. The band states the lesson: whether clinical AI reaches patients is decided by the institutional governing system, regulation, payment, coordination, more than by the model. Transition: takeaways.

Takeaways and outlook

01

The bottleneck on deployed clinical AI is institutional, regulation, payment, coordination, not model quality.

02

Same three governing systems define clinical AI: the US approves, Europe regulates, Asia deploys.

03

Open weights reach the bedside fastest under state coordination; the US and EU still lack a generative-clinical-AI pathway.

04

Measure what matters: shift clinical-AI evaluation from agreement-with-labels to patient outcomes.

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 20 – Takeaways and outlook

Takeaways

Four closers: one, the bottleneck is institutional not technical. Two, the regulate-build-deploy split holds, US approves, Europe regulates, Asia deploys. Three, open weights reach the bedside fastest under state coordination, while the US and EU lack a generative-clinical pathway. Four, the field needs to measure patient outcomes, not label-agreement. Then references and questions.

SUPPLEMENT

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI

Slide 22 – Supplement

Backup material beyond the core talk: Asia beyond China.

Asia beyond China

INDIA

POPULATION-SCALE

Sarvam (govt-backed sovereign LLM) + Krutrim, under the national IndiaAI Mission. AI layered on UPI / Aadhaar at population scale; Qure.ai screens TB nationally.

IndiaAI Mission; PIB 2025

SOUTH KOREA

CLINICAL-AI EXPORTER

Naver HyperCLOVA X, LG EXAONE (open-weight), Samsung Gauss, backed by a national AI fund. Lunit + VUNO export FDA-cleared clinical AI worldwide.

MSIT; TechCrunch 2025

JAPAN

INNOVATION-FIRST

Sakana AI, the country's top unicorn; SoftBank owns ~11% of OpenAI. No-penalty AI law; AI-hospital pilots; Rapidus chasing a 2nm fab.

AI Promotion Act 2025

SOUTHEAST ASIA

THE BATTLEGROUND

SEA-LION switched from Meta's Llama to Alibaba's Qwen; Sahabat-AI (Indonesia), FPT (Vietnam). US and Chinese models compete for the next billion users.

TechNode 2025

Curtis Chambers · Jinchi Wei · CPH 200C · Computational Precision Health · Three Governing Systems for Clinical AI · 2026-06-04

Slide 23 – Asia beyond China (supplement)

Backup slide if time allows or if asked: the third governing system is not one country, so I frame each by its distinctive role rather than by spend. India is population-scale: a government-anointed sovereign model (Sarvam) and AI layered onto UPI and Aadhaar, with Qure.ai screening tuberculosis nationally. South Korea is the clinical-AI exporter: open-weight EXAONE and Naver at home, and Lunit and VUNO selling FDA-cleared clinical AI abroad. Japan is innovation-first, a no-penalty AI law, Sakana as its top unicorn, and SoftBank's roughly 11 percent stake in OpenAI. Southeast Asia is the live battleground, where its flagship SEA-LION model switched from Meta's Llama to Alibaba's Qwen. The takeaway: when we say Asia, China leads, but Korea, Japan, and India each run their own stack.

Thank You
